

wireframe model of the page layout

details of the colour scheme and fonts

For several reasons, a white, grey, and black colour scheme is commonly utilized in website design.

Neutral: These colours are neutral and give your website a clean and uncluttered look, making it easier for users to read and navigate.

Simplicity: Using these colours helps keep the design clean and prevents users from being overwhelmed with bright colours or distracting images.

Professionalism: The selection of fonts and colours on this site may be used to convey a sense of professionalism and give the site a more polished and accurate look and feel.

Contrast: By choosing black text on a white or light Gray background, you create a high contrast that makes the text easier for the visually impaired to read.

a short description justifying your choice of layout.

The design I chose for the website is mobile friendly and responsive style with an emphasis on readability, usability and simplicity.

I chose a white, Gray and black colour palette and a simple, minimalist structure to give the site a sleek, no-nonsense look without overwhelming the consumer with flashy imagery or excessive colour. Sans-serif fonts help maintain a modern, clean look while improving readability.

Users can easily access different sections of the site thanks to a clear navigation menu at the top of the page. Using clear and concise labels for each part helps users understand the available content more quickly. To make it easier for users to find the information they need, the content is divided into parts, each with a clear hierarchy, highlighting and highlighting

important content. Using photos and multimedia content makes your website more interesting and visually appealing.

By using a responsive design, your website looks great and is easy to use on a variety of devices, from giant desktop screens to small mobile phones. This is especially important given the increasing use of mobile devices to browse the web.

Ultimately, this theme was created to provide a clean, professional and user-friendly experience for website visitors.

an evaluation of your implementation justifying any changes between your initial design and your implementation

My initial goal was to set up a site where I could read light novels online, but my lack of hardware knowledge (requiring a server to process the data) prevented me from creating a website that interact with database. Also html and CSS can't accomplish this, which means I need to implement other scripting languages to interact with databases such as JavaScript and other resources such as digital copies of light novels. Additionally, the website is customized to meet the original purpose of reading light novels, so this website redirects the user to his Amazon page that sells the novels.

Furthermore, even though filtering design is implemented but it does not work as it require scripting language to interact with database to make it possible.

an outline of how you tested your website.

Functional testing: Personally inspect and test all features of the website. For example, make sure that interactivity such as buttons and redirects work, and that links can be used to submit forms.

- checked that the website loads properly, and all links are working.
- Verify that the website displays the correct information about each novel, including the cover image, synopsis, and reviews.

Usability testing: evaluates how user-friendly and intuitive a website's interface and user experience are. User tests can be conducted with real users to get their opinion on the design, navigation and content of your website. This can be done by sending out survey.

- Tested the website's navigation and user interface, ensuring that it is intuitive and easy to use.
- Tested the website's responsiveness and ensure that it works well on different devices and screen sizes.

Compatibility testing: involves verifying the functionality of her website on various browsers, devices and operating systems. To test your site on different platforms, you can use mobile emulators and browser testing tools.

- Tested the website on different browsers and operating systems to ensure compatibility.
- checked that the website works well with different screen sizes and resolutions.
